

Actran™ for Nastran

Advanced Vibro-Acoustic Analysis Combining Actran and Nastran

Product Overview

Combine the strength of Actran and Nastran for advanced vibro-acoustic modeling

Actran is a powerful tool for modeling and analyzing complex vibro-acoustic systems and specifically trimmed vehicle bodies. Trim components are usually made of materials with high damping and strong acoustic absorption characteristics; as such they have a significant influence on the overall vibro-acoustic behavior of the vehicle body.

Actran models are usually available in physical coordinates in order to simulate accurately the complex damping mechanism provided by the trim components.

Nastran is the reference tool for vibro-acoustic analysis of lightly damped structures and cavities. It features efficient modal solution sequences, making it suitable for handling large models like automotive vehicle body-in-white or aircraft fuselage.

Actran for Nastran provides CAE engineers with advanced features for mixing the best of both tools: Actran physical model and Nastran modal model.

Three types of combined models may be created:

1. Actran for Nastran is able to merge a set of Actran models of individual trim components with a Nastran body-in-white model in order to create a fully trimmed body vibro-acoustic model.
2. An Actran model may be set in its real-life working environment by connecting it to an existing Nastran model (e.g. a detailed Actran model of a layered windshield may be connected to a Nastran model of the vehicle body).
3. A Nastran model may be enriched by including a reduced Actran model of a specific component. The Actran component is defined as a DMIG data block in the Nastran deck.

Actran for Nastran makes the vibro-acoustic analysis of fully trimmed bodies accurate and efficient. With the hybrid methods, the strength of modal and physical approaches are combined.

Target Applications

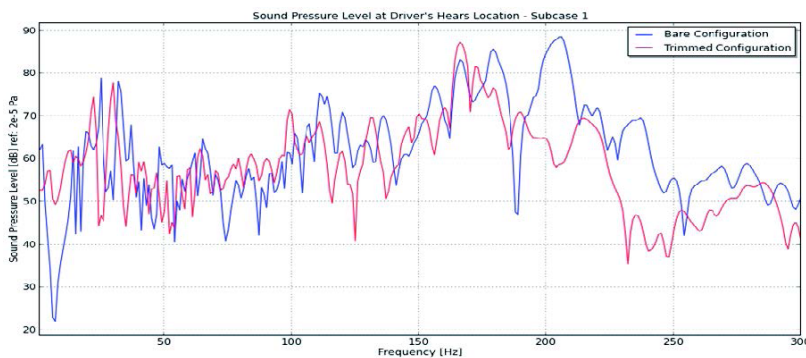

- Trimmed body NVH with accurate modeling of the trim components (headliner, dashboard, floor, etc.)
- Acoustic transmission through components in real-life mounting conditions

Key Features

- Analysis of fully trimmed models combining Nastran body-in-white models with Actran trim models
- Import of Nastran super-elements into Actran
- Export of Actran components to Nastran using DMIG data blocks
- Support of most Nastran brands (MSC, MD, NX, NEI)
- Available platforms: Windows 32 & 64 bits, Linux and most Unix platforms
- Integration in Actran VI

The use of acoustic trim is ubiquitous in cars.

Analysis of vehicle body NVH with accurate modeling of three trim components: headliner, dashboard & floor. Comparison between results of simple body model (blue curve) and trimmed body model (red curve)

Actran Software Suite

Actran is a complete acoustic, vibro-acoustic and aero-acoustic CAE software suite. Empowered by the technologies of finite/infinite element methods (FE/IFE), as well as the Discontinuous Galerkin Method (DGM), Actran provides a rich library of materials, elements, boundary conditions, solution schemes and solvers. Actran is a high accuracy, high performance and high productivity modeling tool suiting the needs of the most demanding engineers, researchers, teachers and students for solving the most challenging acoustic problems.

Free Field Technologies (FFT)

Free Field Technologies is focused on three main areas:

- Developing Actran software for acoustic, aero-acoustic and vibro-acoustic simulation;
- Providing technical services, support, training and delivering acoustic engineering projects;
- Researching innovative technologies and methods of acoustic analysis in order to remain the leader in acoustic modeling.

Free Field Technologies has more than 250 customers around the world active in the Automotive, Aerospace, Shipbuilding, Electronic and Heavy Equipment industries as well as in the Educational and Research sectors.

FFT is a wholly owned subsidiary of MSC Software Corporation.
